ABSTRACT

While trying to speed up its industrial growth, a developing country may overlook the need of proper waste management in the process. When resources are wasted and environmental and public health and safety are harmed as a result of a lack of forethought, the consequences may be dire. By resolving to do something about the waste at a later date, the penalty is not avoided or reduced. The rate of trash creation normally grows in direct proportion to a nation's advancement in development. If you think that making progress in your developmental status is more important than maintaining a livable atmosphere, you're mistaken, and you'll still pay the price. The more degraded the environment, the more difficult it is to restore it to its original state. As a general rule, efforts to protect or improve environmental quality should not fall short of those made to promote human progress.
